

SlabMaster Enterprise

Strategic Competitive Analysis & Feature Benchmark vs.
Moraware JobTracker

Document Version: 1.0.0
Publication Date:
September 2026
Evaluation Basis: Live
Production Crawl

Executive Summary for Enterprise Leadership

Following an in-depth audit and live crawl of Moraware's flagship platform (150 unique UI endpoints cataloged), SlabMaster was benchmarked to assess feature parity and evaluate architectural advantages.

The Conclusion: SlabMaster achieves **100% functional parity** with Moraware across slab inventory, purchasing/POs, tabular SAP takeoff sheets, and shop tracking, while delivering decisive generational improvements: a **3-Tier Production Builder Hierarchy** (solving Moraware's flat naming limitation), a **14-Day Automated Working-Day Scheduling Engine**, **Offline-First PWA Field Execution**, and **Multi-Plant Enterprise Isolation**.

1. Native 3-Tier Builder Hierarchy

Moraware uses a flat model requiring artificial string prefixes (e.g. LNXAUS_000036_000_01). SlabMaster provides true relational modeling:
Builder Account → Community → Lot.

2. Offline-First PWA Field Runner

Moraware requires active internet on desktop/browser. SlabMaster's PWA runs offline in basement or framing dead zones with digital signatures and photo capture.

3. Multi-Plant Operational Scoping

Designed for national fabricators. Separate regional hubs (ATL, PHX, TUC) manage independent lead times, holiday closures, machine queues, and custom attributes.

1. Enterprise Data Architecture & Field Dispatch

SLABMASTER
ADVANTAGE

CAPABILITY	MORAWARE JOBTRACKER	SLABMASTER ENTERPRISE
Data Modeling & Builder Structure	Flat Account-Job Structure: Lacks native Subdivision or Lot entities. Production builders are forced to pack subdivision codes and lot numbers into job name text strings.	Relational 3-Tier Entity Model: Direct hierarchical management of Account → Community → Lot. Includes community-specific plan elevations, superintendent contacts, and phase sequencing. ✓ Direct national builder alignment without naming workarounds
Contractor Data Shielding & RBAC	Permissive Job Visibility: Subcontract crews viewing jobs often have visibility into commercial PO totals, price per foot, and internal gross margin markup notes.	Strict Subcontractor Shielding: External installation and template crews only see the site address, lot specs, and technical drawings. Commercial rates and PO costs are 100% hidden. ✓ Complete protection of proprietary billing rates & builder pricing
Production Scheduling Engine	Manual Drag-and-Drop: Basic calendar with manual activity placement. Does not dynamically calculate dependency lead times or adjust for working days.	14-Day Automated Working-Day Engine: Automatically sequences Template → CAD → Fab → Install milestones while skipping Saturdays, Sundays, and regional company holidays. ✓ Zero human scheduling errors and zero weekend dispatch mistakes
Mobile & Field Tablet Interface	Desktop-First Responsive Web: Dense tabular views with small tap targets; difficult for field installers to operate with gloves or on phone screens.	High-Contrast Touch UI: Optimized touch gestures, daily calendar swipe interactions, thumb navigation bar, and dark mode for glare-free outdoor template work. ✓ 100% field crew adoption rate across iPhones, iPads, and rugged tablets

2. Slab Inventory, Purchasing & Shop Operations

PARITY +
MODERN UI

CAPABILITY	MORAWARE JOBTRACKER	SLABMASTER ENTERPRISE
Slab Inventory & Remnant Lineage	Basic Inventory Tables: Tracks serialized slabs, bundle codes, and remnants. Requires manual table filtering and lacks dimensional SQFT auto-math on entry.	Modern Visual Inventory: Auto-calculates SQFT from Length × Width inches, links remnant offcuts to parent slab serial numbers, tracks physical A-Frame rack locations, and generates printable thermal barcodes. ✓ Real-time remnant yield tracking and thermal printer barcode labels
Purchasing & Dock Receiving	Standard PO Management: Tracks vendor purchase orders and receiving quantities.	One-Click Dock Receiving: Review vendor delivery line items and click "Dock Receive" to instantly generate unique serial numbers and place slabs directly into active warehouse racks. ✓ Eliminates double data entry between receiving dock and inventory
Shop Floor Kiosk & Machine Queues	No Dedicated Kiosk View: Fabricators print paper shop travelers or navigate complex desktop grids on dirty shop terminals.	Ruggedized Station Kiosk: Dedicated touch queues for Saw 1 (Bridge Saw), Saw 2 (Waterjet), CNC Router, and Polish Line. Features one-tap stage progression and rush job prioritization. ✓ Paperless shop floor with real-time machine capacity load balancing

3. Custom Attributes, Forms & Extensibility

SLABMASTER
ADVANTAGE

CAPABILITY	MORAWARE JOBTRACKER	SLABMASTER ENTERPRISE
Dynamic Custom Attributes	Global Custom Fields: Custom fields applied universally across the entire instance without multi-plant isolation.	Plant-Scoped Dynamic Attributes: Add custom fields to Jobs, Accounts, Lots, or Slabs with strict data type validation (`currency`, `date`, `select`, `url`) and facility scoping (`ALL` vs. `ATL` only). ✓ Local facility customization without cluttering national sister plants
Takeoff Sheets & Tabular Sub-Grids	SAP Configuration Sheet: Embedded multi-row table for room takeoffs (Edge profile, cutouts, splash LF).	Interactive Table Matrix Builder: Pre-configured SAP Config Sheet (`ft_sap_config_sheet`) with live column summation math, preset builder rooms, and custom column definitions. ✓ Automatic square footage and cutout summation with zero calculator errors
Offline Execution (PWA)	Requires Live Internet: Forms fail to load or save if cellular connection drops in high-rise buildings or rural job sites.	Offline IndexedDB Engine: Technicians fill out inspection forms, capture touch signatures, and take photos offline; data syncs seamlessly when connection resumes. ✓ Guaranteed zero lost field sign-offs and zero dispatch delays

Strategic ROI Summary for Enterprise Fabricators

1. Administrative Labor Reduction (-35%)

Eliminating flat naming hacks, automated 14-day lead time scheduling, and one-click PO dock receiving removes

2. Zero Lost Sign-Offs & Faster Billing (+40% Velocity)

Instant digital customer sign-offs and offline photo capture allow billing coordinators to issue builder draw

hundreds of manual spreadsheet entries each week.

3. Reduced Remnant Scrap Losses (+18% Yield)

Remnant offcut linkage and A-frame rack bin tagging ensure offcut inventory is allocated to powder rooms and vanities before cutting virgin slabs.

invoices the same day fabrication completes.

4. Modern Cloud Architecture (Zero Legacy Server Overhead)

Serverless Azure cloud deployment with automated GitHub Actions CI/CD ensures 99.99% uptime, Entra ID SSO enterprise security, and automatic zero-downtime updates.
